Your New Puppy...

In addition to your love and attention, regular trips to the veterinarian will assure your puppy's continued health. The following items will help keep your puppy happy and content.

- ✓ A chew-proof bed or a crate for sleeping and when you need to leave your puppy alone.
 - Sleeping area needs to be warm and dry.
- ✓ Food and fresh water.
 - Choose heavy bowls to reduce spills.
 - Consult with your veterinarian as to the frequency, type and amount of food to give at each meal.
 - Provide a bowl of fresh water at all times.
- ✓ A collar, identification tag and a leash.
 - Provide plenty of exercise for your puppy.
- ✓ "Puppy Proof" your home...
 - Use baby gates to keep your puppy out of forbidden areas.
 - Remove chemicals, cleansers, trash cans, house plants, electrical cords and other hazards your curious puppy may find within reach.
- ✓ Comb and brush for grooming.
 - Brush long-haired breeds daily to prevent matting.
 - Regular grooming of all breeds will control shedding.
- ✓ Toys! Puppies and dogs love to play.
 - Choose sturdy chew toys, squeaky toys and balls.
 - Inspect toys for loose pieces; replace the toy when they happen.

NOTES

3-D Your New Puppy

Your New Kitten...

In addition to your love and attention, regular trips to the veterinarian will assure your kittens continued health. The following items will help keep your kitten happy and content.

- ✓ A basket or box with low sides lined with a soft blanket for sleeping.
 - Sleeping area needs to be warm and dry.
- ✓ A litterbox filled with clean, odor-inhibiting litter.
 - Remove soiled litter daily and refresh.
 - Clean litter pan weekly and fill with fresh litter.
- ✓ A scratching post or scratching board.
 - Even if your cat has been declawed, provide a climbing tower or playthings that encourage exercise.
- ✓ Comb and brush for grooming.
 - Brush long-haired cats daily to prevent matting.
 - All cats should be brushed daily when shedding.
- ✓ Food and fresh water.
 - Choose sturdy, stable bowls to reduce spills.
 - Consult with your veterinarian as to the frequency and amount of food to give at each meal.
 - Provide a bowl of fresh water at all times.
- ✓ Cat grass.
 - Helps cats to rid themselves of the hair they swallow when grooming themselves.
- ✓ Toys! Kittens and cats love to play.
 - Choose an artificial mouse, balls, cat lures, rattles.
 - Your cat will let you know which ones they like best.

THIS AND THAT ABOUT YOUR DOG

- Puppies can be house-broken by using a regular routine of going outside 4-6 times per day.
- Almost all puppies have worms.
- Feeding raw meat does **NOT** cause worms.
- Puppies cut teeth between 4-6 months of age and need a towel or chew stick.
- Pet dogs do **NOT** need to chew bones for good teeth development.
- We suggest spaying female pet dogs at 6-8 months. It is not necessary to have a heat period or litter to insure a healthy dog. Spaying does not cause your dog to become fat, but overfeeding will.
- Male dogs can be altered after 6 months when medically indicated.
- Dogs normally shed hair 2-3 times per year. Some shed a little all year.
- Dogs should be brushed weekly and bathed 4-7 times per year.
- Normal temperature of the dog is 101.5°.
- Most common canine diseases are not transmissible to humans.
- With normal sanitary precautions dog worms are **NOT** transmissible to us.

DIET SUGGESTIONS

- Puppies should be fed 3-4 times per day as colic results from too much food.
- Puppies diet should be 50% meat (ground beef, horsemeat, or P/D) and 50% cereal (pabulum, puppy starter meal or I/D) mixed together. Also can mix cooked eggs, cottage cheese, table vegetables, milk, etc. to the meat-cereal mixture.
- Too much milk can cause diarrhea.
- Eggs must be cooked and they do improve the hair coat.
- A pinch of salt may be added if table scraps or commercial dog food is not fed.
- Meat may be raw or cooked.
- Adult dogs must be fed 50% meat and 50% cereal plus the extras as well.
- You can adjust your dog's weight by how much volume of food you feed.

We wish to suggest an annual physical exam and booster for Distemper and Hepatitis as a means of preventative medicine to help insure the longevity of your pet.

10-D About Your Dog

Your new puppy and care of its health.

A Good Start: Puppies come into the hands of new owners from many different environments. Some are received in a fat and healthy condition. Others are sick and undernourished from the start. Most puppies, however, come to new owners in a physical condition somewhere between these two extremes. For this reason an *initial health examination* is suggested just as soon as the puppy is acquired. Professional recommendations can thus be made based upon the particular background and problems of your puppy.

Periodic Examinations: At the time of the initial examination, arrangements should also be made for regularly scheduled examinations. These often nip disease and health problems in the bud. They are the most economical way to assure the health of your growing pup. Inoculations can also be given at the time these periodic examinations are conducted.

Inoculations: Four of the most common and serious diseases of dogs can, in most instances, be prevented with the use of vaccines and serums. These diseases are canine distemper, canine infectious hepatitis, leptospirosis and rabies. The proper age for inoculations varies with the individual animal and the type of serum or vaccine used. A vaccination schedule should be arranged at one of the early examinations.

It is important to remember that one can not be sure that a vaccine (either for animal or human use) will be 100% effective; however, vaccines are effective in most cases. Likewise, a vaccine will seldom confer lifelong immunity. Therefore, "booster shots" are recommended at prescribed intervals.

Diet: There are many different and acceptable methods of feeding puppies and the periodic examinations recommended above provide an opportunity to obtain professional help in the proper nourishment of your puppy. The need for special vitamins and iron supplements may be uncovered during routine health examinations and minor supplemental suggestions in the feeding program can bring improved appetite, a finer hair coat and a more vigorous animal. The amount of food given at each meal varies with the breed and the individual, but overfeeding is one of the most common causes of digestive troubles in young animals. Specific professional directions can remedy this problem.

Intestinal Parasites: Puppies frequently harbor one or more varieties of worms. Bring a stool specimen with you at the time of regular health examinations to determine if intestinal parasites are a problem in your puppy. Type of worms, severity and the proper medication can thus be accurately determined. Indiscriminate worming is unnecessary, even dangerous.

Emotional Health: Very young puppies or new dogs should not be overwhelmed, roughly handled, or given too much attention. A puppy, like a baby, needs plenty of sleep. A fixed routine is very good - in fact dogs thrive on routine.

Signs of Sickness: The first signs of sickness are usually listlessness and unexplainable loss of appetite. More pronounced symptoms then follow. Early attention means faster response. If listlessness, loss of appetite or other unusual symptoms should occur, call promptly for an appointment.

16-D Canine Immunization

CANINE IMMUNIZATIONS

Many canine diseases can now be prevented through vaccination. A vaccination schedule prepared by your veterinarian can thus greatly contribute to good health and a longer life span for your dog. Below are the most important diseases for which vaccines are currently available:

Canine distemper is a widespread, often fatal disease. All dogs should be vaccinated against distemper, starting with distemper-measles vaccination at 6-9 weeks of age.

Canine adenovirus type-1 and type-2 cause infectious hepatitis and respiratory infection, respectively. Hepatitis caused by adenovirus type-1 may cause severe kidney damage or death. Adenovirus type-2 is an important factor in kennel cough.

Canine bordetella may contribute to kennel cough. This bacterial infection can occur alone or in combination with distemper, adenovirus type-2 infection, parainfluenza and other respiratory problems.

Canine leptospirosis is a bacterial infection of the kidneys sometimes involving other organs such as the liver. The disease is easily spread to other pets and to humans. Dogs which recover from leptospirosis may suffer per-manent kidney damage.

Canine parainfluenza is another cause of kennel cough. Although parainfluenza is often a mild respiratory infection in otherwise healthy dogs, it can be severe in puppies or debilitated dogs. It is caused by a combination of bacteria and virus and is highly contagious.

Canine parvovirus infection is a disease of widespread distribution which may cause severe dehydrating diarrhea in dogs of varying ages. Parvovirus infection is especially dangerous for puppies.

Rabies, one of the world's most publicized and feared diseases, is almost always fatal. Rabies virus attacks the brain and central nervous system, and is transmitted to humans chiefly through the bite of an infected animal.

Canine coronavirus infection is a highly contagious intestinal disease causing vomiting and diarrhea in dogs of all ages. Especially in young puppies, dehydration from coronavirus infection can be life-threatening.

Lyme is a tick-borne bacterial disease which afflicts dogs but is also prevalent in mice, deer, rabbits and humans. The most common clinical symptoms include fever, loss of appetite and arthritis.

18-D Canine Immunizations

FELINE IMMUNIZATIONS

Many feline diseases can now be prevented through vaccination. A vaccination schedule prepared by your veterinarian can thus greatly contribute to good health and a longer life span for your cat. Below are the most important diseases for which vaccines are currently available:

Rabies, one of the world's most publicized and feared diseases, is almost always fatal. Rabies virus attacks the brain and central nervous system, and is transmitted to humans chiefly through the bite of an infected animal.

Feline panleukopenia (feline distemper) is among the most widespread of all cat diseases and is extremely contagious. Characterized by fever, loss of appetite, vomiting and diarrhea, feline panleukopenia causes high death loss, particularly among kittens. Even older cats that recover from panleukopenia may never totally regain their health.

Feline viral rhinotracheitis (FVR) is a highly contagious respiratory disease characterized by sneezing, loss of appetite, fever and eye inflammation. Although few adult cats die from FVR, the death rate among kittens can range from 50 to 60 percent. Feline viral rhinotracheitis often occurs simultaneously with feline calicivirus infection.

Feline calicivirus (FCV) is another serious feline respiratory infection, often occurring simultaneously with feline viral rhinotracheitis. Signs of infection are similar to FVR, but calicivirus infected cats may also have ulcers on the tongue. Feline calicivirus most severely affects kittens and debilitated cats.

Feline pneumonitis (chlamydia) is a third common respiratory ailment in cats. Signs of pneumonitis are similar to those of FVR and FCV (sneezing, fever, loss of appetite, nasal discharge, inflamed eyes). Also like other respiratory diseases, pneumonitis can be complicated by bacterial infections which result in pneumonia or meningitis.

Feline leukemia is a viral disease which can take several forms. Some cats have transient infections with few ill effects. Others have persistent infections varying in severity, some of which may be fatal over time. Cats are most commonly exposed to feline leukemia virus through contact with another infected cat; thus, likelihood of infection is greater in multi-cat households or where cats are allowed to roam free.

FIP (feline infectious peritonitis) is a disease of cats caused by a virus similar to members of the coronavirus family. Symptoms include gradual weight loss, depression, weakness, fever and diarrhea. It can afflict cats of any age, sex or breed. There currently is no cure.

18-C Feline Immunizations
